13. Andreea-Mădălina Geman, Andreea Luicianu, Olteanu Mihaela: *Using Methods for Collecting Data in the Benefit of the Local Community*

In this paper we are highlighting the benefits of creating and using forms for collecting data, through new applications possibilities regarding the main changes that can occur in the urban environment and supporting the local community.

These forms can be accessed from mobile devices and the reported results can be analyzed using a desktop application. The users are able to send their location linked with attribute data.

This approach can be successfully used in a working team or can be disseminated for interested community members, as a crowdsourcing possibility. Crowdsourcing is evolving as a distributed way for solving different problems. The beneficiaries could be town halls or institutions with a key role in urban planning and utility companies.
